

# EDUCATIONAL FRAMEWORK IMPROVEMENT REPORT

*Aphrodite's Harvest & Learn About Bees*

---

Interface Design, Bottleneck Analysis & Revised Framework

Prepared by Group S1-13  
Adelaide University · 2026

## 1. Introduction

---

This report is for a revised Educational Framework for the Aphrodite's Harvest Learn About Bees platform, a beekeeping education business based in Adelaide, Australia and the internet domain name aphroditesharvest.com.au. It is an extension of the original framework design created by Group S1-13, and adds a structured analysis of the bottlenecks discovered on the live WordPress site.

The fundamental issue that was found was that the platform provided useful courses and support services, but looked like a collection of flat product listings, lacking any learning path. That report espoused a theoretically sound approach, but this revision aims to fill the gap between the theoretical design and what already exists on the live site — and to identify and suggest additions which build on the existing platform, content and the client's WordPress-only operational constraint.

Any proposed improvements in this report are additions. There are no pages, products, forms, navigation items or services removed from or replaced by the current page. The four level learning structure from the original framework is retained and implemented based on the 6-course offerings that are live. Events and Support services remain and are more closely linked to the learner journey.

## 2. Problem Identification

---

The initial report singled out a key design element of the platform where courses and support services existed but were not linked into a seamless learning system. By checking the live website, this review confirms this diagnosis and will also highlight any extra more specific problems that have arisen in the live implementation.

There is a list of six products on the Courses page of aphroditesharvest.com.au/course-selections-bookings, with prices from \$65 to \$270. These range from beginner courses to specialist Varroa workshops, 60 minutes of professional inspections, and mentoring bundles – none of them differentiated, no level labels, and no direction on where to begin. The first time visitor, probably an inexperienced beekeeper who isn't technically savvy, is presented with a jumble of purchase choices with no apparent starting point.

Although the Support page is substantive, it is completely separate. Mentoring and consultation services are neither mentioned in the Courses page as a logical step after completing course content nor are they presented as an extension of the course learning in the Support page. The Events page shows just one event, has no date, and two CTA buttons pointing to wrong pages. A true asset, the feedback form is used on all pages with the same context.

These are not content failures as the platform does have good content. They are structural and signposting failures, which is exactly why the original structure was created to help address the problem.

## 3. Framework Requirements

---

The requirements table below contains all seven requirements from the original framework, and also includes a 'status' column to show whether each requirement is present in this revised design, or whether it is enhanced. There is no downgrade of requirements or deletion.

| Requirement | Identified Need | Priority | Status |
|-------------|-----------------|----------|--------|
|-------------|-----------------|----------|--------|

|                                        |                                                |        |            |
|----------------------------------------|------------------------------------------------|--------|------------|
| <b>Simple &amp; Practical Content</b>  | Client preference; supports beginners          | High   | ✓ Retained |
| <b>Structured Learning Path</b>        | No current course ordering visible on site     | High   | ✓ Enhanced |
| <b>Modular Content Delivery</b>        | Long product descriptions, no lesson structure | High   | ✓ Enhanced |
| <b>Link Learning to Support</b>        | Services exist but are buried separately       | Medium | ✓ Enhanced |
| <b>Easy Navigation &amp; Usability</b> | Non-technical user base; flat product grid     | High   | ✓ Enhanced |
| <b>Flexible / Self-Paced Access</b>    | Diverse learner levels and pace                | Medium | ✓ Retained |
| <b>WordPress-Compatible</b>            | No redevelopment budget or timeline            | High   | ✓ Retained |

Table 1 — Original requirements mapped to their revised status in the improved framework.

## 4. Bottleneck Analysis

They found eight specific blockages by directly reviewing the live website on the three main pages Courses, Support and Events. Each of the bottlenecks corresponds to a structural issue, a proposed solution and a proposed implementation timeframe in WordPress.

| # | Bottleneck                            | Description                                                                             | Fix                     | Effort   |
|---|---------------------------------------|-----------------------------------------------------------------------------------------|-------------------------|----------|
| 1 | <b>No Entry Point Guidance</b>        | Courses open as a flat product grid with no level indicator or 'start here' signal      | Level Selector Banner   | Low      |
| 2 | <b>Courses &amp; Support Mixed</b>    | Mentoring and inspection products listed beside beginner courses — no visual separation | Section Headings        | Very Low |
| 3 | <b>No Learning → Support Link</b>     | Completing a course gives no nudge toward mentoring or events                           | Contextual Support Tips | Low      |
| 4 | <b>Events Page Is a Dead End</b>      | One event listed with no date, description, or direct booking CTA                       | Event Detail Blocks     | Very Low |
| 5 | <b>Generic Contact Form</b>           | Identical form on every page regardless of user context or intent                       | Enquiry Type Selector   | Very Low |
| 6 | <b>No Course Descriptions in Grid</b> | Products show only name and price — learner must click each to understand content       | Short Descriptors       | Very Low |

|   |                                     |                                                                                     |                      |          |
|---|-------------------------------------|-------------------------------------------------------------------------------------|----------------------|----------|
| 7 | <b>Bundle Discount Not Surfaced</b> | 10% discount for 5 sessions exists on Support page only — invisible on Courses page | Cross-Promo Callout  | Very Low |
| 8 | <b>Zero Reviews Displayed</b>       | All products show 0/5 rating — trust signal missing at purchase decision point      | Google Review Prompt | Very Low |

Table 2 — Eight bottlenecks identified on the live site, mapped to proposed additive fixes and effort ratings.

The biggest problem is there is no entry point on the Courses page at any level. The four-level learning structure is theoretically sound and appropriate to the domain, however, it is not visible to the user, unless there is a mechanism to filter or orient the learner by skill level. The second very significant issue is the merging of a structured course with one to one support services in one genericised grid, creating decision paralysis rather than guided choice.

Lower effort improvements (e.g. short description on product cards, existing 10% discount on the bundle, prompting Google reviews) have an disproportionately high impact for the effort needed to implement, since they only involve standard WooCommerce content fields and no technical development.

## 5. Theoretical Foundations

The updated framework maintains the four theoretical bases of the original framework and provides additional detail for each of them to respond to the specific constraints encountered during the live site review. For each theory, the table below shows both the original and the new application in the new framework.

| Theory                              | Application                                                                                         | Key Principles                     | Revised Application                                    |
|-------------------------------------|-----------------------------------------------------------------------------------------------------|------------------------------------|--------------------------------------------------------|
| <b>Information Architecture</b>     | Structures the platform into Levels, Courses, Modules — content is findable and logically organised | Hierarchy, labelling, navigation   | Level selector; section headings on Courses page       |
| <b>User-Centred Design (UCD)</b>    | Ensures simple navigation and clear learning flow tailored to beginners and non-technical users     | Usability, task analysis, personas | Short course descriptors; filtered grid by level       |
| <b>Cognitive Load Theory</b>        | Content divided into small lessons reduces mental effort and improves comprehension                 | Chunking, segmentation, clarity    | Separated courses vs. support; no information overload |
| <b>Experiential Learning Theory</b> | Courses provide knowledge; support services provide                                                 | Reflection, active experimentation | Contextual support tips; post-course next steps        |

|  |                                        |  |  |
|--|----------------------------------------|--|--|
|  | application and active experimentation |  |  |
|--|----------------------------------------|--|--|

Table 3 — Theoretical foundations mapped to original and revised applications in the improved framework.

Theoretically, the new Levels/Courses/Modules/Lessons hierarchy has been reflected in the information architecture, but in the Courses page, a new filter appeared in the Select Course - Select Level combination: the Select Level Banner. Short course descriptors and section headings separating the sections, extend User-Centred Design, reducing cognitive effort for any non-technical visitor to make a purchase decision. Although originally cognitive load theory was incorporated into the design of lessons, it has also been incorporated at the page level: the product grid is divided into courses and support services. Experiential Learning Theory is put into practice with contextual support tips that follow each course description, which serves as the active experimentation part of the learning cycle, rather than as formal commercial products, mentoring and workshops.

## 6. Learning Level Structure

There is no change to the four-level learning structure in the original framework, which is fully retained, and it is directly mapped to the six live courses on the website. This mapping operationalises the structure so that it can take place in the existing product catalogue without new courses being developed.

### Diagram 1: Four-Level Learning Structure

|                                                              |                                                               |                                                                    |                                                           |
|--------------------------------------------------------------|---------------------------------------------------------------|--------------------------------------------------------------------|-----------------------------------------------------------|
| <b>L1</b><br><b>Beginner</b><br><i>Beekeeping Essentials</i> | <b>L2</b><br><b>Intermediate</b><br><i>Seasonal Hive Mgmt</i> | <b>L3</b><br><b>Specialist</b><br><i>Varroa &amp; Pest Control</i> | <b>L4</b><br><b>Advanced</b><br><i>Continued Learning</i> |
|--------------------------------------------------------------|---------------------------------------------------------------|--------------------------------------------------------------------|-----------------------------------------------------------|

Diagram 1 — The four progression levels mapped to live course offerings and recommended support services.

| Level   | Stage        | Courses (Live)                                      | Focus Area                                    | Recommended Support           |
|---------|--------------|-----------------------------------------------------|-----------------------------------------------|-------------------------------|
| Level 1 | Beginner     | Beekeeping Essentials (Jan–Apr 2026)                | Bee biology, hive setup, basic equipment      | Mentoring at your Apiary      |
| Level 2 | Intermediate | Seasonal Hive Management Spring & Summer            | Practical hive care, seasonal rhythms         | 1-Hr Apiary Consultation      |
| Level 3 | Specialist   | Getting to Grips with Varroa Varroa Mite Inspection | Varroa management, pest control (SA-specific) | Phone Consultation + Workshop |

|                |                 |                                             |                                          |                                        |
|----------------|-----------------|---------------------------------------------|------------------------------------------|----------------------------------------|
| <b>Level 4</b> | <b>Advanced</b> | Mentoring Mini Bundle<br>Continued Learning | Advanced techniques, ongoing development | All support services; community events |
|----------------|-----------------|---------------------------------------------|------------------------------------------|----------------------------------------|

Table 4 — Live course offerings mapped to the four-level structure with corresponding support service recommendations.

Level 1 (Beginner) corresponds to the Beekeeping Essentials course January to April 2026. Level 2 (Intermediate) is equivalent to Seasonal Hive Management, which includes practical hive maintenance throughout the seasons. In the South Australian context, in the face of an active Varroa incursion, Level 3 (Specialist) is mapped to the Getting to Grips with Varroa workshop series and to the service Varroa Mite Inspection — which is significant as these are the only two services that are relevant in South Australia. The Mentoring Mini Bundle and further development of mentored beekeepers fall into the Advanced (Level 4) category.

The main tweak to the original set-up is that this mapping is now automatically linked to the actual product catalogue. This mapping is used with the Level Selector Banner from Section 7 to filter the Product Grid dynamically, so that only the showing relevant courses and support services for the selected level appear, rather than having to cross tab all 6 levels at once.

## 7. User Flow Design & IA Architecture

### 7.1 User Flow Design

The five-step user journey of the original framework remains intact and is extended to include the Events page and the feedback form as part of the user journey. The original design didn't explicitly integrate Events. For the revised flow, Events are now available in Levels 2-4, and are viewed as a community engagement layer, especially for the Varroa Management Training event.

Diagram 2: Five-Stage User Flow

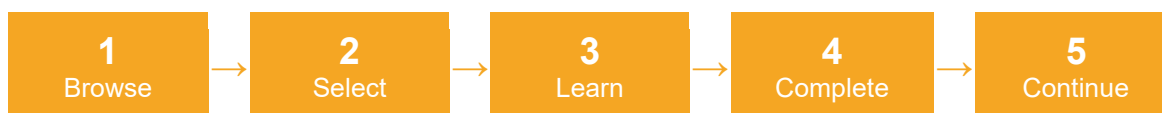

Diagram 2 — The five-stage learner journey from initial browsing through to continued engagement.

The Browse stage now starts with a Level Selector, instead of a plain product grid, which immediately orients the learner. The Select stage returns a subset of courses with a brief description along with a suggested support service for the context. The Learn stage, which is only available for in-person courses at this time, is supported by an internal structure created in the form of contents framing, as described in the wireframe analysis. The Google review prompt and recommended next course are added to the Complete stage. The Continue stage now has explicit connections with Events & Support as long-term engagement mechanisms.

## 7.2 Information Architecture

The Information Architecture (IA) of the Educational Framework defines how educational content, navigation pathways, and support services are organised within the platform. The proposed structure transforms the existing flat course catalogue into a hierarchical and scalable learning ecosystem that improves usability, content discoverability, and learner progression.

The previous platform structure primarily followed a transactional flow:

**Home → Courses → Course Detail → Purchase**

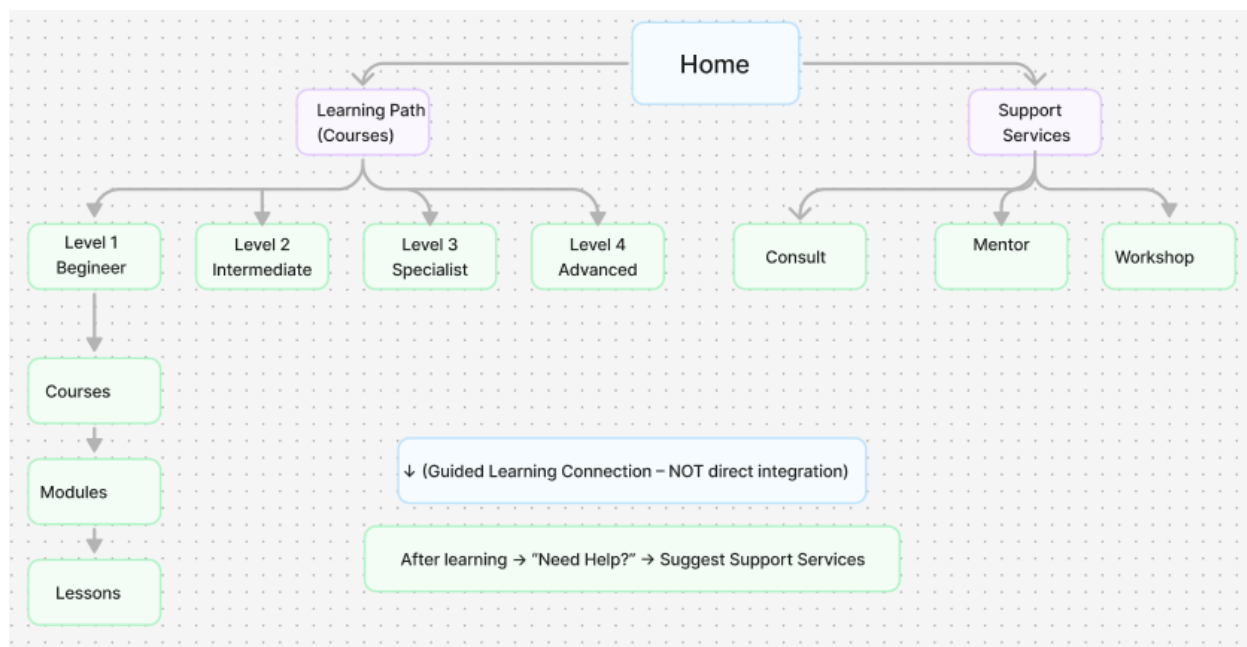

Although this structure enabled access to educational products, it did not support structured learning. Learners were required to independently determine where to begin, how courses related to each other, and when support services such as mentoring or consultation should be used. This increased cognitive effort and created an inconsistent learning experience, particularly for beginner and non-technical users.

The proposed Information Architecture addresses these limitations by separating the platform into two clearly defined systems:

- Learning Content System
- Support Services System

While these systems remain structurally separate, guided navigation allows users to move logically between learning and practical application when required.

### Proposed IA Structure

This structure ensures that users first interact with high-level learning categories before progressing into detailed course content. The hierarchy mirrors the real-world learning progression of beekeepers, allowing learners to navigate the system more naturally and confidently.

## 8. Wireframe Screen Analysis

The original three screen wireframe layout is preserved as is and updated as needed with any newly implemented bottlenecks, but also with the actual pages on the live site. Every screen is associated with one step in the user flow and has a theoretical rationale.

| Screen   | Name                    | Key Components                                                                                               | Theoretical Justification                                                                     |
|----------|-------------------------|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| Screen 1 | Home / Learning Path    | Level selector cards, filtered course list, user flow progress bar, descriptors                              | IA + UCD — immediate orientation; reduces entry friction and decision overload                |
| Screen 2 | Course / Lesson View    | Sidebar progress tracker, breadcrumb nav, lesson content panel, contextual support tip                       | Cognitive Load Theory — modular lessons prevent overwhelm; tip bridges theory to practice     |
| Screen 3 | Completion & Next Steps | Completion banner, recommended next course, support services as 'apply' options, social share, review prompt | Experiential Learning — connects knowledge to real-world application; activates trust signals |

Table 5 — Three-screen wireframe analysis updated to reflect revised components and theoretical justifications.

### 8.1 Screen 1 — Home and Learning Path (Revised)

The main changes to Screen 1 are the addition of the Level Selector Banner above the current product grid. By clicking any of the four cards (Beginner, Intermediate, Specialist, Advanced) you will narrow the course selections below. This filter is implemented using the existing WooCommerce category taxonomy, no development required.

The Course Grid below the Level Selector is split into two visual chunks with basic headings of Courses (structured learning) and Support Services (personalised one-on-one support). The separation removes the current cause of decision paralysis due to conflating course products and support bookings. Using the WooCommerce short description field, short product descriptions are added to the product cards, providing learners with information on what they will get and who for, without forcing them to click through to the card's page.

### 8.2 Screen 2 — Course and Lesson View (Revised)

The two-column design kept in the original Screen 2 is still the target design for the LMS implementation, the sidebar progress tracker and the panel for the lesson content are still present. What's new in the updated framework is the Contextual Support Tip found at the bottom of each lesson panel.

This tip highlights a particular, relevant support service that is pertinent to the course topic—those taking a Varroa module are encouraged to think about booking a Varroa Mite Inspection and those completing a hive set-up module are encouraged to think about booking Mentoring at Your Apiary. The tip is clearly separate from the lesson content (shown in a honey-amber bordered box) and has an immediate link to the support booking page. This is a link between the Courses and Support sections of the site only to fill it up the structural void, without the necessity of redesigning navigation.

### 8.3 Screen 3 — Course Completion and Next Steps (Revised)

The screen of Completion is extended in two ways. The first is the addition of a Google review prompt along with the completion confirmation which points to the existing Google Maps review link in the site footer. The first step is to add a Google review prompt along with the completion warning, with a link to the existing Google Maps review link in the site footer. This triggers the social proof mechanism at the best time, after a positive learning experience, and solves the zero-rating issue that was detected in the bottleneck analysis.

Secondly, the Apply What You've Learned section has been updated with the appropriate upcoming Event (where applicable) in addition to Consultation, Mentoring, and Workshops. An individual who has finished the Varroa course, for instance, would have the next Varroa Mite Management Training event displayed as a community learning opportunity. For the first time, this brings the hitherto separate Events page into the core learner journey.

## 9. Proposed Improvements

The following eight improvements are all additive and do not involve removing or reorganizing existing products, content, navigation and/or forms. All can be done without custom development in WordPress and WooCommerce!.

1

#### Level Selector Banner

Add four level-card filter above the product grid on the Courses page. Clicking a level filters the grid to show only relevant courses using WooCommerce category taxonomy. Implementable as a standard WordPress page element.

2

#### Section Headings: Courses vs. Support Services

Add two visual section headings within the existing product grid to separate structured courses from one-on-one support bookings. No products are moved or removed — visual separation only.

3

#### Contextual Support Tips After Each Course

Add a short contextual tip below each course listing (and on individual product pages) recommending a specific related support service. Example: 'After this course, consider booking a Mentoring at Your Apiary session to apply what you've learned.'

4

#### Events Page: Date, Description & Direct CTA

Add a date, one-paragraph description, and a 'Register for this Event' button to the Varroa Mite Management Training listing. Update CTA buttons to link to the correct destination. Add a note connecting the event to the Level 3 learning path.

5

#### Contact Form: Enquiry Type Selector

Add a single dropdown field at the top of the existing form: 'I'm enquiring about: [A Course / One-on-One Support / An Event / Something Else]'. No existing fields are changed. Gives Aphrodite context when receiving submissions.

6

### Short Course Descriptors in Product Grid

Add a two-line short description to each course card using the WooCommerce short description field. Include: who it's for, format (in-person), and date range. Eliminates the need to click through to each product just to understand its content.

7

### Bundle Discount Cross-Promotion

Add a callout near the Mentoring Mini Bundle on the Courses page surfacing the 10% discount for booking five support sessions — currently mentioned only on the Support page. One line of content; zero technical work.

8

### Google Review Prompt on Course Completion

Add a 'Completed this course? Leave a review →' prompt linking to the existing Google Maps review link on course product pages and the completion screen. Activates social proof at the point of highest learner satisfaction.

## 10. Ethical and Societal Considerations

All ethical concerns of the original remain and are expanded to encompass the changes made. Each consideration is correlated with a design response in the enhanced framework in the Table below.

| Consideration           | Standard                            | Design Response                                                                         | Revised Approach                                                               |
|-------------------------|-------------------------------------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Accessibility</b>    | WCAG 2.1 compliance                 | High-contrast honey gold/white scheme; clear typographic hierarchy; alt-text on visuals | Retained + enhanced colour contrast in level cards                             |
| <b>Inclusivity</b>      | Diverse learner base                | Self-paced; revisitable content; level-based entry points now surfaced on live site     | Level selector makes entry points visible, not assumed                         |
| <b>Privacy</b>          | Australian Privacy Principles (APP) | No personal data collected in course flow; feedback form collects only minimal context  | Enquiry-type field added — no extra personal data collected                    |
| <b>Content Accuracy</b> | Biosecurity — Varroa parasite (SA)  | Expert-verified content; mentoring recommended for real-world pest decisions            | Contextual tip after Varroa courses explicitly recommends professional support |
| <b>Client Autonomy</b>  | WordPress self-management           | All improvements are no-code; maintainable by business owner independently              | No additional technical dependency introduced                                  |

Table 6 — Ethical considerations from the original framework mapped to revised design responses.

The content accuracy of this revision is the most important ethical issue when considering the Varroa mite invasion in South Australia. Integrating a beginner Varroa course with a professional Varroa inspection service, as the current flat grid does, is a real biosecurity risk because learners may underestimate the complexities of real-world decision making regarding pest management. To mitigate this risk, the revised framework will include a Varroa Mite Inspection as a support service, and a contextual tip for professional inspection before implementing in the field.

## 11. Technical Feasibility

All the eight suggested changes are possible without any custom development or backend changes for WordPress and WooCommerce. The table below shows the correspondence between each improvement and the mechanism for implementing it.

| # | Improvement              | WordPress Implementation                                    | Difficulty |
|---|--------------------------|-------------------------------------------------------------|------------|
| 1 | Level Selector Banner    | WooCommerce category filter; page builder cards (Elementor) | Low        |
| 2 | Section Headings         | Elementor text/heading block above product grid             | Very Low   |
| 3 | Contextual Support Tips  | WooCommerce product description field + linked button       | Low        |
| 4 | Events Page Fix          | Add text, date, and corrected button links in Elementor     | Very Low   |
| 5 | Form Enquiry Dropdown    | Contact Form 7 or WPForms select field addition             | Very Low   |
| 6 | Short Course Descriptors | WooCommerce short description field per product             | Very Low   |
| 7 | Bundle Discount Callout  | Elementor text widget or WooCommerce product notice         | Very Low   |
| 8 | Review Prompt            | WooCommerce thank-you page custom text + hyperlink          | Very Low   |

Table 7 — Each improvement mapped to its WordPress implementation mechanism and effort rating.

The most technically advanced improvement is the Level Selector Banner (Improvement 1), which involves creating WooCommerce product categories for each level and adding a filter widget to Elementor, which are simple and normal enough tasks in the current page builder. Other enhancements can be done only by editing existing WordPress fields for content or tweaking existing form and button settings.

The project will produce an 8 improvements self-management guide to help the client maintain and update the 8 improvements plan once the project lifecycle is over.

## 12. Conclusion

---

The Educational Framework for Aphrodite's Harvest had identified a real and meaningful structural issue: a strong content platform (or course) that lacked a learning system that would guide learners through the content as a kind of learner journey. This revision establishes that as a fact, by direct analysis of the live website, and proposes eight targeted, additive improvements that operationalise the original theory without disrupting what currently works.

The learning structure of Beginner, Intermediate, Specialist and Advanced is still there as a backbone of the framework and is directly linked with the six live course offerings. The theoretical concepts of Information Architecture, User-Centred Design, Cognitive Load Theory and Experiential Learning Theory are all put into practice when designing the improved design: The hierarchy is visible, the section headings reduce the cognitive load, the contextual support tips bring learning and practice together, and the completion screen brings the experiential cycle to life.

Most importantly, no custom development is required for all proposed improvements—these are all possible within WordPress and WooCommerce interface. They are quick to produce, have a high return on investment and can be maintained by the business owner alone. This new framework is not a substitute for the existing platform it is just to put the structure it has all along.

---
